The machine is a wheeled excavator with a 360 degree slew movement.

The machine is equipped with a computerized monitoring system, vehicle control unit (V-ECU) which in turn works with engine control unit (E-ECU).

The machine is equipped with a Volvo D6E, tier 3 compliant, low-emission diesel engine, which is adapted for this excavator model. The engine is controlled by an engine control unit (E-ECU).

The diesel engine drives the machine's working pump, which gives hydraulic flow to the working hydraulics and the travel motor. Gear pump supplies the servo hydraulics. The fan pump mounted on the engine supplies the hydraulic flow to the cooling fan motor for the radiator, hydraulic oil cooler, charge air cooler and air conditioner condenser. The tandem pump is mounted behind the working pump. The hydraulic system is monitored and controlled by the vehicle control unit (V-ECU).

The machine has a load-sensing hydraulic system which always ensures that each movement receives oil according to the demand.

Propulsion of the machine is obtained with a hydraulic travel motor with variable displacement.

The travel gearbox has two hydraulically controlled gears. It is a so-called Powershift gearbox, which means that shifting is possible on the move. The brakes for gear shifting are applied automatically with spring force and released with servo pressure. The parking brake is applied with spring force, is integrated in the gearbox and uses the gearbox brake discs.

The superstructure is slewed using an axial piston motor with integrated planetary gear. The slew brake is applied automatically by spring force and released with the system pressure.

The slew pinion drives against a slew ring with internal ring gear. The slew ring connects the superstructure with the undercarriage.

A centre passage connects the superstructure and undercarriage hydraulically and electrically.

The cab is equipped with an ergonomic operator's seat, ventilation and filtration system. The cab is also prepared for air conditioning (option).

Different combinations of boom, dipper arm and attachments can be offered. This manual describes the most common standard alternatives.

When ordering spare parts and when making enquiries on the telephone or by correspondence, the model designation and serial number should be given. When applicable, the information marked on individual parts should also be given.

Bolts and nuts

The pretensioning force achieved at a given tightening torque depends on the coefficient of friction of the bolted joint. The coefficient of friction in turn depends on the surface texture, surface treatment and lubricated condition. The values are calculated assuming a coefficient of friction of 0.2 for a dry chromated flange bolt and 0.15 for a lubricated chromated flange bolt. The lower torque for Allen bolts and traditional hex bolts, in relation to flange bolts, is due to the shorter torque arm for the frictional force under the bolt head (smaller diameter of bolt head).

The following abbreviations for surface treatment are used in the tables:

- Fe/Zn-Fe = Black chromated zinc - iron
- FZB = Blank chromated

NOTE!

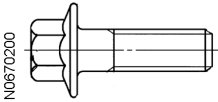

In some body parts, there are weld bolts with much lower strength than normal bolts of the same dimension.

NOTE!

When Nordloc washer is used, increase the torque by 20%.

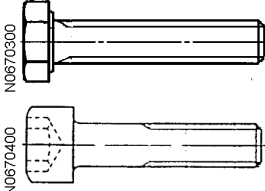

NOTE!

Bolts provided with liquid alt. micro-capsuled thread locker or thread sealant shall be tightened with the same torque as a lubricated bolt of the same type.

Tolerances

Modern high-quality torque wrenches normally give a variation of $\pm 5\%$ of the indicated value. This, together with variations in friction coefficient, gives a range in the pretensioning force of approximately $\pm 16\%$ for lubricated bolted joints and $\pm 29\%$

% for dry bolted joints.
