EW200B Volvo			

EW200B is a wheeled excavator with a 360 degree slew movement.

The machine is equipped with a computerized monitoring system, vehicle control unit (V-ECU) which in turn works with engine control unit (E-ECU) and hydraulic control unit (T-ECU).

The machine is equipped with a Volvo Cologne D6D low-emission diesel engine, which is adapted for this excavator model. The engine is controlled by an engine control unit (E-ECU).

The diesel engine drives the machine's working pump, which gives hydraulic flow to the working hydraulics and the travel motor. One part of a double gear pump supplies the servo hydraulics and cooling fan for hydraulic oil cooler with hydraulic flow. The other part, brake and steering circuit with hydraulic flow. The brake circuit has priority over the steering circuit. The tandem pump is mounted behind the working pump. The hydraulic system is monitored and controlled by the transmission control unit (T-ECU).

The machine has a load-sensing hydraulic system which always ensures that each movement receives oil according to the demand.

Propulsion of the machine is obtained with a hydraulic travel motor with variable displacement.

The travel gearbox has two hydraulically controlled gears. It is a so-called Powershift gearbox, which means that shifting is possible on the move. The brakes for gearshifting are applied automatically with spring force and released with servo pressure. The parking brake is applied with spring force, is integrated in the gearbox and uses the gearbox brake discs.

The superstructure is slewed using an axial piston motor with integrated planetary gear. The slew brake is negative, that is, it is applied automatically by spring force and released with the system pressure.

The slew pinion drives against a slew ring with internal ring gear. The slew ring connects the superstructure with the undercarriage.

A centre passage connects the superstructure and undercarriage hydraulically and electrically.

The cab is equipped with an ergonomic operator's seat, ventilation and filtration system. The cab is also prepared for air conditioning.

The boom cylinders are provided with one directional valve each, with built in blocking valves. They also function as hose rupture valves.

Different combinations of boom, dipper arm and attachments can be offered. This manual describes the most common standard alternatives.

When ordering spare parts and when making enquiries on the telephone or by correspondence, the model designation and serial number should be given. When applicable, the information marked on individual parts should also be given.

When ordering spare parts, and in all telephone enquiries or correspondence the model designation and the Product Identification Number (PIN) must always be quoted.

Product plate

The product plate on the machine shows the manufacturer's name and address, model designation, PIN, machine weight, engine output, production year and year of delivery. There is also room for the CE mark. The plate is positioned under the boom on the superstructure frame.

Engine product plate

The engine product plate contains type designation and part and serial numbers and is positioned on the engine inside the rear engine cover on the right side of the machine.

Travel gearbox product plate

The gearbox product plate contains type designation and part and serial numbers and is positioned on the travel gearbox.

Axle product plate

The axle product plate contains type designation and part and serial numbers and is positioned on each axle.

The tightening torques in the following tables apply to bolts and nuts with tensile strength. The tables should be used as a general instruction for tightening bolts and nuts without specified values. The charts contains values for course thread bolts and nuts.

Torque values should be increased with $\approx 10\%$, for flange bolts.

All standard torques for bolts are without surface treatment.

The standard torque for bolts lubricated with oil should be reduced with 20% of the given value.

Bolts and nuts

The pretensioning force achieved at a given tightening torque depends on the coefficient of friction of the bolted joint. The coefficient of friction in turn depends on the surface texture, surface treatment and lubricated condition. The values are calculated assuming a coefficient of friction of 0.2 for a dry chromated flange bolt and 0.15 for a lubricated chromated flange bolt. The lower torque for Allen bolts and traditional hex bolts, in relation to flange bolts, is due to the shorter torque arm for the frictional force under the bolt head (smaller diameter of bolt head).

The following abbreviations for surface treatment are used in the tables:

- Fe/Zn-Fe = Black chromated zinc - iron
- FZB = Blank chromated

NOTE!

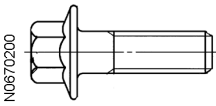

In some body parts, there are weld bolts with much lower strength than normal bolts of the same dimension.

NOTE!

When Nordloc washer is used, increase the torque by 20%.

NOTE!

Bolts provided with liquid alt. micro-capsuled thread locker or thread sealant shall be tightened with the same torque as a lubricated bolt of the same type.

Tolerances

Modern high-quality torque wrenches normally give a variation of $\pm 5\%$ of the indicated value. This, together with variations in friction coefficient, gives a range in the pretensioning force of approximately $\pm 16\%$ for lubricated bolted joints and $\pm 29\%$

% for dry bolted joints.
